## Problem 1. $\chi^2$ Distribution

Prove that  $p(\chi^2)$  is distributed with Chisquare  $(\nu)$ .

a. Prove for  $x_i \sim Normal(0, \sigma)$ 

We know that since there is only one independent variable with zero mean value,

$$\chi^2 = (\frac{x_i}{\sigma})^2 = \frac{1}{\sigma^2} x_i^2$$

$$x_i \sim N(0, \sigma)$$

$$\chi^2 = Y = \frac{X^2}{\sigma^2}$$

$$F_Y(y) = P(Y \le y) = P(-\sigma\sqrt{y} \le |X| \le \sigma\sqrt{y}) = CDF_X(\sigma\sqrt{y}) - CDF_X(-\sigma\sqrt{y})$$

$$p(\chi^2) = \frac{dF}{dy} = \frac{\sigma}{2\sqrt{y}} \cdot (PDF_X(\sigma\sqrt{y}) + PDF_X(-\sigma\sqrt{y})$$

The PDF of X is symmetric about x=0,

$$p(\chi^2) = \frac{\sigma}{\sqrt{y}} PDF_X(\sigma\sqrt{y}) = \frac{\sigma}{\sqrt{\chi^2}} \frac{1}{\sqrt{2\pi}\sigma} exp(-\frac{1}{2}\chi^2)$$
$$= \frac{1}{\sqrt{2\pi}} \chi^{-\frac{1}{2}} exp(-\frac{1}{2}\chi^2)$$

which is Chisquare(1).

## b. Prove for an arbitrary number of $x_i \sim Normal(0, \sigma)$

The characteristic function of  $\chi^2$  is,

$$E[e^{it\chi^2}] = E[e^{it(Y_1 + Y_2 + \dots Y_N)}]$$
$$Y_i = \frac{x_i^2}{\sigma_i^2} = Y_i(x_i)$$

Expand this in integral form,

$$E[e^{it(Y_1+Y_2+...Y_N)}] = \int e^{it(Y_1+Y_2+...Y_N)} f(x_1, x_2, ...x_N) \ d(x_1, x_2, ...x_N)$$

Since these random variables are independent,

$$f(x_1, x_2, ... x_N) = \prod_{i=0}^{N} f(x_i)$$
$$E[e^{it(Y_1 + Y_2 + ... Y_N)}] = \prod_{i=0}^{N} \int_{-\infty}^{\infty} e^{itY_i} f(x_i) \ dx_i$$

Compute characteristic function for single  $Y_i$ ,

$$f(x_i) = \frac{1}{\sigma\sqrt{2\pi}}exp(-\frac{1}{2}(\frac{x_i}{\sigma})^2) = \frac{1}{\sigma_i\sqrt{2\pi}}exp(-\frac{1}{2}Y_i)$$
(1)

$$x_i = \sigma_i \sqrt{Y_i} \tag{2}$$

$$dx_i = \sigma_i \frac{1}{2\sqrt{Y_i}} dY_i \tag{3}$$

$$\int_{-\infty}^{\infty} e^{itY_i} f(x_i) \ dx_i = \int_{-\infty}^{\infty} e^{itY_i} f(Y_i) \sigma_i \frac{1}{2\sqrt{Y_i}} \ dY_i$$
 (4)

$$= \frac{\sigma_i}{2} \int_{-\infty}^{\infty} \frac{1}{\sigma_i \sqrt{2\pi}} exp(-\frac{1}{2}Y_i^2) \cdot exp[itY_i] \frac{1}{\sqrt{Y_i}} dY_i$$
 (5)

$$= \frac{1}{2\sqrt{2\pi}} \int_{-\infty}^{\infty} exp(-\frac{1}{2}Y_i) \cdot exp[itY_i] \frac{1}{\sqrt{Y_i}} dY_i$$
 (6)

$$= \frac{1}{2\sqrt{2\pi}} \int_{-\infty}^{\infty} exp\left[\left(-\frac{1}{2} + it\right)Y_i\right] \cdot \frac{1}{\sqrt{Y_i}} dY_i \tag{7}$$

At this point, it is more convenient to adopt the notation of  $x_i^2$ , and I realized it was completely useless to replace  $dx_i$  to  $dY_i$ .

$$\int_{-\infty}^{\infty} e^{itY_i} f(x_i) \ dx_i = \frac{1}{\sqrt{2\pi}\sigma_i} \int_{-\infty}^{\infty} exp[(-\frac{1}{2} + it) \frac{x_i^2}{\sigma^2}] \ dx_i$$
$$= \frac{1}{\sqrt{2\pi}\sigma_i} \sqrt{\frac{2\pi}{1 - 2it}} \sigma_i = (1 - 2it)^{-\frac{1}{2}}$$

The characteristic function of  $\chi^2$  is,

$$[(1-2it)^{-\frac{1}{2}}]^N$$

where  $N = \nu$ . This is just the characteristic function of chisquared distribution.

#### b. Prove that shifting mean values doesn't matter

Adopting the same notation of  $Y_i$ , now we get,

$$Y_i = \left(\frac{x_i - \mu_i}{\sigma_i}\right)^2$$
$$x_i = \sigma_i \sqrt{Y_i} + \mu_i$$

We notice that this doesn't change equation 3, and therefore equation 7 is not affected and is still equal to  $(1-2it)^{1/2}$ . It follows that values of  $\mu_i$  doesn't affect chisquared distribution. Chisquared distribution only depends on N, the number of independent random variables.

#### Problem 2

# d. Calculate the confidence of b1 while marginalizing other b parameters

As taken from David's notes,

$$\rho(\vec{x}) = \frac{1}{\sqrt{(2\pi)^N |\Sigma|}} \cdot exp(-\frac{1}{2}\vec{x}^T(\Sigma)^{-1}\vec{x})$$

This is adapted to a probability density function of  $\vec{b}$  with non-zero mean vector,

$$\rho(\vec{b}) = \frac{1}{\sqrt{(2\pi)^N |\Sigma|}} \cdot exp[-\frac{1}{2} (\vec{b} - \vec{b}_{max})^T (\Sigma)^{-1} (\vec{b} - \vec{b}_{max})]$$

With marginalization on every component except b1, this becomes,

$$\rho(b_1) = \frac{1}{\sqrt{2\pi|\Sigma_{11}|}} \cdot exp[-\frac{1}{2}(b_1 - b_1(max))^2(\Sigma_{11})^{-1}]$$

Therefore, the 68~% confidence interval becomes evaluations of the following two integrals,

$$\int_{-\infty}^{b_{lower}} \rho(b) \ db = 0.16$$

$$\int_{b_{higher}}^{\infty} \rho(b) \ db = 0.84$$

We notice that the probability density distribution function is just a normal distribution with  $\sigma = \sqrt{\Sigma_{11}}$  and  $\mu = b_1(max)$ . Therefore, we know that the 68 % confidence interval is roughly,

$$[b(max) - \sqrt{\Sigma_{11}}, b(max) + \sqrt{\Sigma_{11}}]$$

The final result is saved in "output.txt".

#### e. Contour plot

We discovered that the distribution is just multivariate normal, with covariance matrix of (b3,b5). I used the *scipy.stats.multivariate\_normal* package to compute the contour plot. See 'output.txt'.
